

Sex ID for Adult ECB:

The adult female is a creamy, yellowish-brown moth approximately 0.75 inches long and about 0.5 inches wide in the resting stage. The wings of the female are usually lighter in color than those of the male. Both sexes have thread like antennae.

***The **abdomen of the FEMALE does not extend beyond the wings at rest** and is usually thicker than male's because of developing eggs. The darker male has a long slender body and is slightly smaller than the female. The **MALE's abdomen extends beyond the closed wings at rest and is usually tufted at the tip.**
